DEF: An equation involving derivatives is called differential equation

There are two types of DE

$$\left\{ \begin{array}{l} 3 - x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = nz \\ 4 - \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = 0 \end{array} \right.$$

Differential Equation

Formation of ODE

DEF The elimination of arbitrary constants present in the equation by utilizing derivatives is called formation of

ODE

$$\begin{aligned} \textcircled{3} \quad y &= ax^3 + bx^2 + cx + d \\ y' &= 3ax^2 + 2bx + c \\ y'' &= 6ax + 2b \\ y''' &= 6a \\ y^{iv} &= 0 \quad \checkmark \quad \text{Ans} \end{aligned}$$

$$\begin{aligned} \textcircled{1} \quad x + y &= a \\ \text{diff. w.r.t } x \\ 1 + \frac{dy}{dx} &= 0 \quad \text{Ans} \end{aligned}$$

$$\begin{aligned} \textcircled{2} \quad y &= A \cos x + B \sin x \quad \textcircled{1} \\ \text{diff. w.r.t } x \\ \frac{dy}{dx} &= -A \sin x + B \cos x \quad \textcircled{2} \\ \text{diff. again w.r.t } x \\ \frac{d^2y}{dx^2} &= -A \cos x - B \sin x \quad \textcircled{3} \\ \text{Add } \textcircled{1} \text{ \& } \textcircled{3} \end{aligned}$$

1. Check all the arbitrary constants
2. Total arbitrary constants in the example, will have to differentiate that number of times
3. There are scenarios in getting answers after differentiation

After differentiating properly, no more diff. afterwards instead simplification takes place

In ex. 1 and 3 after proper diff. we get the ans..and that is the ans..instead in ex 2 after diff. that's not the ans, we have to simplify it in order to get

$$(4) \quad Ax^2 + By^2 = 1 \quad \text{--- (1)}$$

from eq (2)

$$2A = -2By'y' - 2Byy'' \quad \text{--- (4)}$$

Substitute this value in Eq. (3)

$$(-2By'y' - 2Byy'')x + 2Byy'y' = 0 \quad \text{--- (5)}$$

Solution of ODE

Order & degree of Differential Eq. (ODE + PDE)

ORDER - The order of any differential Eq. is the order of the highest-derivative term that appears in the diff. Eq.

- 2- Reducible to Separable

- 4- Reducible to homogeneous

- 6- Reducible to linear (Bernoulli's)

① Separable Variables

The general form is

$$N(x) dx = M(y) dy$$

OR $N(y) dy = M(x) dx$

Ex1 $\frac{dy}{dx} = \frac{2x}{y+x^2y}$

$$\frac{dy}{dx} = \frac{2x}{y(1+x^2)}$$

$$y \cdot dy = \frac{2x}{1+x^2} dx$$

Integrate both sides

$$\int y \cdot dy = \int \frac{2x}{1+x^2} dx$$

$$\frac{y^2}{2} = \ln(1+x^2) + C$$

$$\text{Ex 2 } y(e^x + 1) - e^x \frac{dy}{dx} = 0$$

$$y(e^x + 1) = e^x \frac{dy}{dx}$$

$$\frac{e^x + 1}{e^x} dx = \frac{1}{y} dy$$

Integrate

$$\int \left(\frac{e^x + 1}{e^x} \right) dx = \int \frac{1}{y} dy$$

$$\int (1 + e^{-x}) dx = \ln y + C$$

$$x - e^{-x} = \ln y + C$$

① Separable

The general form is

$$N(x) dx = M(y) dy$$

OR $N(y) dy = M(x) dx$

$$\text{Ex 1 } \frac{dy}{dx} = \frac{2x}{y + x^2 y}$$

$$\frac{dy}{dx} = \frac{2x}{y(1 + x^2)}$$

$$y \cdot dy = \frac{2x}{1 + x^2} dx$$

Integrate both side

$$\int y \cdot dy = \int \frac{2x}{1 + x^2} dx$$

$$\frac{y^2}{2} = \ln(1 + x^2) + C$$

Solving Partial fractions

$$\frac{1}{y(1-ay)} = \frac{A}{y} + \frac{B}{1-ay} \quad \text{--- (1)}$$

$$1 = A(1-ay) + By \quad \text{--- (2)}$$

Substitute $y=0$ in (2)

$$1 = A(1-0) + B(0)$$

$$\Rightarrow \boxed{A=1}$$

Substitute $y=\frac{1}{a}$ in (2)

$$1 = A(1-a\frac{1}{a}) + B\frac{1}{a}$$

$$1 = A(1-1) + \frac{B}{a}$$

$$1 = 0 + \frac{B}{a}$$

$$\boxed{a=B}$$

Ex 3

$$y - x \frac{dy}{dx} = a(y^2 + \frac{dy}{dx})$$

$$y - x \frac{dy}{dx} = ay^2 + a \frac{dy}{dx}$$

$$y - ay^2 = a \frac{dy}{dx} + x \frac{dy}{dx}$$

$$y - ay^2 = (a+x) \frac{dy}{dx}$$

$$\Rightarrow \frac{1}{a+x} dx = \frac{1}{y-ay^2} dy$$

$$\int \frac{1}{a+x} dx = \int \frac{1}{y-ay^2} dy$$

$$\ln(a+x) = \int \frac{1}{y(1-ay)} dy$$

By using Partial fractions

$$\frac{1}{y(1-ay)} = \frac{A}{y} + \frac{B}{1-ay} \quad \text{--- (1)}$$

$$1 = A(1-ay) + By \quad \text{--- (2)}$$

Substitute $y=0$ in (2)

$$1 = A(1-0) + B(0)$$

$$\Rightarrow \boxed{A=1}$$

Substitute $y = \frac{1}{a}$ in (2)

$$1 = A(1-a \cdot \frac{1}{a}) + B \cdot \frac{1}{a}$$

$$1 = A(1-1) + B \cdot \frac{1}{a}$$

$$\Rightarrow \boxed{B=a}$$

Hence

$$\frac{1}{y(1-ay)} = \frac{1}{y} + \frac{a}{1-ay}$$

from (1)

$$\ln(a+x) = \int \left(\frac{1}{y} + \frac{a}{1-ay} \right) dy$$

$$\ln(a+x) = \ln y - \ln(1-ay) + \ln C$$

$$\Rightarrow \frac{1}{a+x} dx = \frac{1}{y-ay^2} dy$$

$$\int \frac{1}{a+x} dx = \int \frac{1}{y-ay^2} dy$$

$$\ln(a+x) = \int \frac{1}{y(1-ay)} dy \quad \text{--- (A)}$$
